**Securing a LAMP server**

**LINUX**

1. Update the machine
    a. *apt-get update*
    b. *apt-get upgrade*
    c. *apt-get dist-upgrade*
2. Install clamtk
    a. *apt-get install clamtk*
    b. Run the scan
        i. *freshclam*
3. Set automatic Updates
    a. System settings>software & updates>Updates
        i. *Automatically check for updates*
        ii. *Important security updates*
4. Search for all prohibited files
    a. *find / -name "*.{extension}" –type f*
5. Configure the firewall
    a. *apt-get install ufw / yum install ufw*
    b. *ufw enable*
    c. *ufw status*
6. Edit the lightdm.conf file
    a. Ubuntu
        i. Edit */etc/lightdm/lightdm.conf or /usr/share/lightdm/lightdm.conf/50-ubuntu.conf*
        ii. *allow-guest=false*
        iii. *greeter0hide-users=true*
        iv. *greeter-show-manual-login=true*
        v. *autologin-user=none*
    b. Debian
        i. Edit */etc/lightdm/lightdm.conf*
            1. *Greeter-hide-users=true*
            2. *Greeter-allow-guest=false*
            3. *Greeter-show-manual-login=true*
            4. *Allow-guest=false*
            5. *Autologin-user=none*
        ii. Edit */etc/gdm3/greeter.dconf-defaults*
            1. *Disable-user-list=true*
            2. *Disable-restart-buttons=true*
            3. *AutomaticLoginEnable = false*
7. Create any missing users
    a. _____
    b. _____
8. Change all the user passwords to "Cyb3rPatr!0t$"
9. Edit the */etc/login.defs*
    a. *FAILLOG_ENAB YES*
    b. *LOG_UNKFAIL_ENAB YES*
    c. *SYSLOG_SU_ENAB YES*
    d. *SYSLOG_SG_ENAB YES*
    e. *PASS_MAX_DAYS 90*
    f. *PASS_MIN_DAYS 10*
    g. *PASS_WARN_AGE 7*
        i. Add the following to the line that ends in difok=3 to /etc/pam.d/common-password
        ii. *ucredit=-1 lcredit=-1 dcredit=-1 ocredit=-1*

10. Delete any users
    a. _____ _____
    b. _____ _____
    c. _____ _____
11. Check the /etc/passwd file
    a. Look for any repeating UID or GID
    b. Make sure no programs have *a /bin/sh or /bin/bash*
    c. Only root should have a UID and GID of 0
12. Check the */etc/group* file and manage the groups
    a. Add all the admins to the *sudo* and *adm* group.
13. Disable the root accounts
    a. *passwd –l root*
14. secure SSH if required
    a. *edit /etc/ssh/sshd_config*
        i. *LoginGraceTime 60*
        ii. *PermitRootLogin no*
        iii. *Protocol 2*
        iv. *PermitEmptyPasswords no*
        v. *PasswordAuthentication yes*
        vi. *X11Fowarding no*
        vii. *UsePAM yes*
        viii. *UsePrivilegeSeparation yes*
15. Secure the */etc/shadow* file
    a. *chmod 640 /etc/shadow*
16. Look for any bad programs
    a. *dpkg –l | grep {PACKAGE}*
        i. *John The Ripper (JTR)*
        ii. *Hydra*
        iii. *Nginx*
        iv. *Samba*
        v. *Bind9*
        vi. *Vsftpd/ftp*
            1. If required then secure the */etc/vsftpd.conf*
                a. *anonymous_enable=ON*
                b. *local_enable=YES*
                c. *write_enable=YES*
                d. *chroot_local_user=YES*
        vii. *Tftpd*
        viii. *X11vnc/tightvncserver*
        ix. *Snmp*
        x. *Nfs*
        xi. *Sendmail/postfix*
        xii. *Xinetd*
17. *Configure /etc/sysctl.conf*
    a. *Sysctl -p*
    b. Add this to the bottom of the */etc/sysctl.conf file*
        i. Disable ICMP redirects
            1. *net.ipv4.conf.all.accept_redirects = 0*
        ii. Disable IP redirecting
            1. *net.ipv4.ip_forward = 0*
            2. *net.ipv4.conf.all.send_redirects = 0*
            3. *net.ipv4.conf.default.send_redirects = 0*
        iii. Disable IP spoofing

1. *net.ipv4.conf.all.rp_filter=1*

iv. Disable IP source routing
1. *net.ipv4.conf.all.accept_source_route=0*

v. SYN Flood Protection
1. *net.ipv4.tcp_max_syn_backlog = 2048*
2. *net.ipv4.tcp_synack_retries = 2*
3. *net.ipv4.tcp_syn_retries = 5*
4. *net.ipv4.tcp_syncookies = 1*

vi. Disable IPV6
1. *net.ipv6.conf.all.disable_ipv6 = 1*
2. *net.ipv6.conf.default.disable_ipv6*
3. *net.ipv6.conf.lo.disable_ipv6*

18. Check cronjobs
    a. Check these folders
        i. */etc/cron.**
        ii. */etc/crontab*
        iii. */var/spool/cron/crontabs*
    b. Check the init files
        i. */etc/init*
        ii. */etc/init.d*
    c. Check for each user
        i. *crontab –u {USER} -l*
19. Check sudoers
    a. When using the *sudo su* command it should always ask for a password, if not
        i. Check */etc/sudoers*
        ii. Or */etc/sudoers.d*
    b. Make sure that there are no *NOPASSWD* values set
        i. Change all of them to *ALL=(ALL:ALL) ALL*
20. *Check the runlevels if unable to boot into GUI*
    a. To check the run level
        i. *runlevel*
    b. Runlevels
        i. *0-System halt;No activity*
        ii. *1-Single user*
        iii. *2-Multi-user, no filesystem*
        iv. *3-Multi-user, commandline only*
        v. *4-user defineable*
        vi. *5-multi-users,GUI*
        vii. *6-Reboot*
    c. *To change the run level*
        i. *Telinit {level}*

**APACHE**

1. Hide Apache Version number.
    a. Add the following lines to the bottom of /etc/apache2/apache2.conf
        i. *ServerSignature Off*
        ii. *ServerTokens Prod*
2. Make sure Apache is running under its own user account and group.
    a. Add a separate user “apache”
    b. Edit the /etc/apache2/apache2.conf file
        i. *User apache*
        ii. *Group apache*
3. Ensure that file outside the web root directory are not accessed. /etc/apache2/apache2.conf
    a. *<Directory />*

*Order Deny,Allow*
*Dent from all*
*Options -Indexes*
*AllowOverride None*
*</Directory>*
*<Directory /html>*
*Order Allow,Deny*
*Allow from all*
*</Directory>*

4. Turn off directory browsing, Follow symbolic links and CGI execution
    a. Add *Options None* to a *<Directory /html>* tag
5. Install modsecurity
    a. *apt-get install mod_security*
    b. *service httpd restart*
6. Lower the Timeout value in */etc/apache2/apache2.conf*
    a. *Timeout 45*

**MySQL**

1. Restrict remote MySQL access
    a. Edit */etc/mysql/my.cnf*
        i. *Bind-address=127.0.0.1*
2. Disable use of LOCAL INFILE
    a. Edit */etc/mysql/my.cnf*
        i. *[mysqld]*
        ii. *local-infile=0*
3. Create Application Specific user
    a. *root@Ubuntu:~# mysql –u root –p*
    b. *mysql> CREATE USER 'myusr'@'localhost' IDENTIFIED BY 'password';*
    c. *mysql> GRANT SELECT,INSERT,UPDATE,DELETE ON mydb.* TO 'myusr'@'localhost' IDENTIFIED BY 'password';*
    d. *mysql> FLUSH PRIVILEGES;*
4. Improve Security with *mysql_secure-installation*
    a. *root@Ubuntu:~# mysql_secure_installation*
        i. *change the root password?: y*
        ii. *Remove anonymous users?: y*
        iii. *Disallow root login remotely?: y*
        iv. *Remove test database and access to it?: y*
        v. *Reload privilege tables now?: y*

**PHP**

1. Restrict PHP Information Leakage
    a. Edit */etc/php5/apaceh2/php.ini*
        i. *expose_php = off*
2. Disable Remote Code Execution
    a. Edit */etc/php5/apache2/php.ini*
        i. *allow_url_fopen=Off*
        ii. *allow_url_include=Off*
3. Disable dangerous PHP Functions
    a. Edit */etc/php5/apache2/php.ini*
        i. *disable_functions=exec,shell_exec,passthru,system,popen,curl_exec,curl_multi_exec,parse_ini_file,show_source,proc_open,pcntl_exec*
4. Enable Limits in PHP
    a. Edit */etc/php5/apache2/php.ini*
        i. *upload_max_filesize = 2M*
        ii. *max_execution_time = 30*
        iii. *max_input_time = 60*
